HDR DATASET NOTE

Maternal health risk assessment, Kurigram

HDR-BD-0001 | version 1.0.0 | 2026-11-11

DOI	Pending, minted at publication
CREATORS	Imad El Badisy
COVERAGE	Bangladesh
PERIOD	2023 to 2023
UNIT	Pregnant woman
LICENCE	CC BY 4.0
LANDING PAGE	https://elbadisyimad.com/hdr/datasets/bd-maternal-health-risk/

Description

Clinical records of 1,205 pregnant women seen at Kurigram General Hospital, a district hospital in rural northern Bangladesh: age, blood pressure, blood sugar, body temperature, body mass index, heart rate, medical history and a pregnancy risk level (low or high).

A recent, openly licensed set of routine antenatal measurements from a rural district hospital, built for the prediction of high-risk pregnancy.

GOOD FOR

- Teaching classification and risk prediction
- Exercises on data cleaning and implausible values

NOT GOOD FOR

- Prevalence of high-risk pregnancy in Bangladesh
- Clinical use (the rule that sets the risk level is not described)

Origin

ORGANISATION	Daffodil International University and Kurigram General Hospital
PUBLICATION	*Mojumdar MU et al. (2025). Maternal health risk factors dataset: clinical parameters and insights from rural Bangladesh. Data in Brief 59: 111363*
COUNTRY	Bangladesh
ADDRESS	https://doi.org/10.17632/p5w98dvbbk.1
ACCESSED	2026-11-11
REUSE TERMS	Published on Mendeley Data under CC BY 4.0 (doi 10.17632/p5w98dvbbk.1); the data article itself is CC BY-NC 4.0.
HOW OBTAINED	Taken from the BioBench R package (dataset highriskpreg), which took them from the biostatlab package, which took them from the Mendeley Data file. Column names were turned into snake_case and blank risk levels coded as missing.

Files

File	Content	Rows	Cols	Size
`maternal_health_risk.csv`	One row per pregnant woman	1,205	13	50 kB
`bd-maternal-health-risk.xlsx`	All tables in one workbook, with About and Variables sheets			69 kB

SHA-256 checksums of every file are listed in `manifest.csv` on the landing page.

Variables

maternal_health_risk.csv One row per pregnant woman

Variable	Type	Description
study_id	integer	Record identifier
age	integer	Age (years)
systolic_bp	integer	Systolic blood pressure (mmHg)
diastolic_bp	integer	Diastolic blood pressure (mmHg)
blood_sugar	number	Blood glucose (mmol/L)
body_temp	integer	Body temperature (degrees Fahrenheit)
bmi	number	Body mass index (kg/m2)
previous_complications	integer	Complications in a previous pregnancy (1 yes, 0 no)
preexisting_diabetes	integer	Diabetes before pregnancy (1 yes, 0 no)
gestational_diabetes	integer	Gestational diabetes (1 yes, 0 no)
mental_health	integer	Current mental health concern (1 yes, 0 no)
heart_rate	integer	Heart rate (beats per minute)
risk_level	string	Pregnancy risk level (Low, High)

Known issues

Read these before analysis.

1. **Demonstration entry.** Taken from the BioBench R package to show how HDR presents a dataset. It has not gone through HDR review and will be removed before launch.
2. **Not the UCI Maternal Health Risk dataset.** That older set (1,013 records, 7 columns) also comes from rural Bangladesh but is a different collection.
3. **Risk level is not defined.** The authors say only that it was set from the clinical parameters; 18 records have no risk level.
4. **Some implausible values**: one age of 325 years and one BMI of 0. 18 records duplicate another record apart from study_id.
5. **Collection dates are vague.** The data article gives only 29 August 2023.
